

The Knowledge Pipeline

An atlas — from raw sources to acted-upon knowledge

-
- 1. Aggregation — the big picture**
distillates flow upward through an hourglass: aggregation → thinking → action
 - 2. Distillation — zoom into one source**
one source → structured distillate → knowledge graph
 - 3. Knowledge Graph — Source schema**
per-source ontology: entities + relationships
 - 4. Knowledge Graph — Complete ontology**
three tiers, end-to-end
 - 5. Execution Framework**
not a plan — a framework that distillates attach to

Sources → Distillates → Graph → Concentrate → Strategy → Action

Stage 1 / Aggregation

the big-picture hourglass — bottom-up: aggregation $\rightarrow$ thinking $\rightarrow$ action

The pipeline as a whole is an hourglass, with data flowing *upward*. At the bottom, a fan of agents **aggregates** distillates from the knowledge tree ($D_{12}, D_{23}, \dots \rightarrow D_{1\dots n}$) — many sources are pulled together by topic. The narrow waist is where **thinking** happens: the aggregated input is compressed and synthesised. The top funnel is **action**: the synthesised thinking emerges and is applied to the world.

- Established experts lose their personal incentive
- Fresh & rising experts

Stage 2 / Distillation

one source → structured distillate → knowledge graph

Zooming into a single source. Each item is processed through six parallel *distillation lenses* — Topic, Author, Implicit Assumptions, Theories, Conclusions, and Methodology. The lens outputs are synthesised into a multi-dimensional distillate D_i , which is then **pushed into the knowledge graph** for downstream use.

Stage 3 / Knowledge Graph

per-source schema — where one distillate lands

Each distillate populates a typed graph with one central **Source/Distillate** node and six entity types: **Author**, **Topic**, **Theory**, **Conclusion**, **Assumption**, **Methodology**. Higher-level entities (**Affiliation**, **Theme**) emerge as natural groupings. As distillates accumulate, shared entities — e.g. the same **Author** or **Topic** across many sources — become hubs that surface non-trivial cross-source connections.

Stage 4 / Complete Ontology

three tiers — Source → Concentrate → Strategy & Action

The full system schema spanning all three tiers. **Tier 1** is the per-source extraction (one Source → one Distillate with six dimensions). **Tier 2** is the cross-source aggregation into a Concentrate ($D_{1...n}$), grouped by Theme. **Tier 3** is the Strategy and Execution Framework, which the Concentrate informs. The dashed orange arc on the right is the key cross-tier link: *every phase in the Execution Framework attaches many Distillates back from Tier 1* (many-to-many).

Complete System Ontology

Three tiers: Source → Concentrate → Strategy & Action

Stage 5 / Execution Framework

*not a plan — a framework that distillates **attach** to*

Execution is *not* a linear plan from Strategy through the four phases. It is a **framework**: each phase — *Concept*, *Coaching*, *Implementation*, *Integration* — is a slot that distilled information can attach to. Deriving the Concept, for example, rests on a collection of Topics, each containing many Distillates. The internal arrows show how phases relate to each other; the deeper relationship — that every Distillate relevant to a phase is attached to it — is what makes the framework actionable.
